Background & Context

The total area of land classified as Less Favoured Area (LFA) on farms in England is 2.2 million hectares. Of this, 1.8 m hectares are farmed- 17% of the total farmed area of England¹. This total is made up of Severely Disadvantaged Areas (SDAs) which account for 67% of the LFA, and Disadvantaged Areas (DAs) accounting for 33% of the LFA. These are areas where farming is more difficult because of poor climate, soils and terrain, which in turn lead to lower yields and higher production and transportation costs. LFAs essentially define the upland hill-farming areas; they include most of the upland areas in the North of England (including the Pennines, Lake District and North York Moors) the Peak District, the English part of the English Welsh border, Exmoor, Dartmoor, and parts of Cornwall.

In England, 27% of beef cows and 40% of female breeding sheep are on commercial LFA grazing livestock farms². Farming plays a crucial role in maintaining the distinctive landscape of such areas.

There are some 11,965 commercial holdings classified as Grazing Livestock (LFA) farms and these account for 1.23 million ha of English farmland (excluding commons)³. While these holdings predominantly farm in the LFA this is not exclusively the case; that is some LFA Grazing livestock farms may farm areas of lowland and some Lowland grazing farms may farm some areas of the LFA. This report presents data representing the 6,285 commercial holdings with a lower size limit of at least 25,000 euros or above of Standard Output (see below).

The continued economic health of the farmers (and other land users and managers) in the uplands is of considerable value to society. The current performance and, hence, economic health of the livestock farmers in the Less Favoured Areas of England is the focus of this report.

This report concentrates on the England Regions, which represent amalgamations of the former Government Office (GO) Regions:

- England West Region comprises the South West and West Midlands GO regions.
- England North Region includes North West, North East and Yorkshire & Humberside GO regions.
- England East Region is the East Midlands, Eastern and South East GO regions.

In comparison to land in the SDA, land in the DA is generally higher-grade agricultural land, is more accessible, and producers have more options to maximise the potential of the land. Under the Basic Payment Scheme (BPS) the DA is subsumed within the lowland region and therefore receives a higher flat rate payment than the SDA. The traditional basis of farming in the LFA is the keeping of beef suckler cows and breeding ewes. The breed of livestock kept corresponds with the type of land; the hills being dominated by hardy breeds and the lower land having more upland and lowland type stock.

The Data: FBS Grazing Livestock Farms (LFA)

The data presented in this publication comes from 172 farms, which are all part of the Farm Business Survey. Fifty nine per cent come from the FBS North Region, 33% from the FBS West Region and the remaining 8% from the FBS East Region. The data have been 'weighted' to represent the total population with each individual farm assigned a weighting factor. Consequently, the 'raised sample'

¹ Defra- Farming in the Uplands- ARCHIVE: Defra, 2010-11

² Data from Defra, June Survey of Agriculture and Horticulture, 2023 <u>Structure of the agricultural industry in England and the UK at June- GOV.UK</u>

³ Data from Defra, June Survey of Agriculture and Horticulture, 2023 <u>Structure of the agricultural industry in England and the UK at June- GOV.UK</u>

provides a basis for estimating the total land use and performance for the LFA, by farm type and by region.

It is important to note that all surveys are subject to sampling error as they are not measuring the whole population, the FBS is no exception. It is common practice to publish 95% confidence intervals and error bars alongside any published estimated figures to give the reader an indication of the size of the sampling error. These signify that we are 95% confident that this range contains the true value. For simplicity within these reports, the confidence intervals have not always been published. Readers should be aware that the figures calculated from the FBS data have a level of uncertainty around them and that all figures are estimates. Generally, the smaller the sample size the greater the sampling error and the less confidence we have in the estimates. For details on the FBS confidence intervals, please refer to Defra FBS publications https://www.gov.uk/government/collections/farm-businesssurvey

The Farm Business Survey classifies farms based upon Standard Outputs (SO)⁴. LFA Grazing Livestock Farms are holdings on which cattle, sheep and other grazing livestock account for more than two thirds of their total SO- except holdings classified as Dairy. Dairy farms are those where dairy cows account for more than two thirds of the total SO (and are excluded from this report). A holding is classified as an LFA holding if 50% or more of its total area is in the LFA. Of holdings classified as LFA, those whose LFA land is wholly or mainly (50% or more) in the SDA are classified as SDA; those whose LFA land is wholly or mainly (more than 50%) in the DA are classified as DA. For the purposes of the survey, only those farms with an SO of at least 25,000 euros are considered, which excludes some 11,000 very small holdings in the LFA.

Within this Grazing Livestock (LFA) group there are four sub-groups-

- Specialist Sheep (SDA)- farms where more than two thirds of the total SO is accounted by sheep, and 50% or more of the total area of the farm is in the LFA, of which 50% or more is in the SDA
- Specialist Beef (SDA)- farms where more than two thirds of the total SO is accounted by beef cattle, and 50% or more of the total area of the farm is in the LFA, of which 50% or more is in the SDA
- Mixed Grazing Livestock (SDA)- farms that are neither specialist sheep or cattle but where
 more than two thirds of the total SGM is accounted by beef cattle and sheep, and 50% or
 more of the total area of the farm is in the LFA, of which 50% or more is in the SDA
- Various Grazing Livestock (DA)- farms where more than two thirds of the total SO is accounted by beef cattle and sheep, and 50% or more of the total area of the farm is in the LFA, of which 50% or more is in the DA

The comparative business performance of LFA farms is illustrated in Figure 1, which compares the Farm Business Income (FBI) per farm earned by the LFA grazing farms and by other farm types in the England FBS sample over the last six years.

⁴ The Standard Output (SO) for a farm business represents the theoretical output for all the agricultural production activities on the farm, based on standard coefficients for each commodity on the farm. The SO is representative of expected output under typical conditions for enterprises of average size and performance. Farms are classified according to the enterprise mix of SOs on a farm. (See Appendix 1 for more information on Standard Output.)

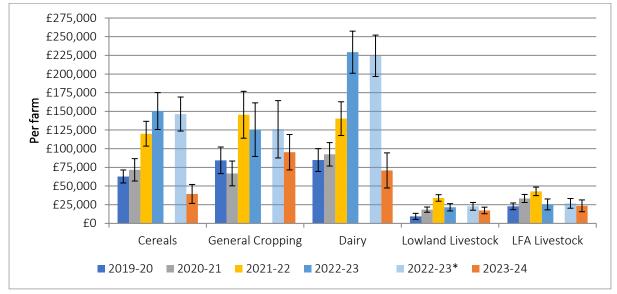

Figure 1 Trends in Farm Business Income £ per farm, in England, by farm type

Source: Farm Business Income by type of farm in England 2023/24- GOV.UK

Farm Business Income (FBI) represents the financial return to all unpaid labour (farmers and spouses, non-principal partners and their spouses and family workers) and on all their capital invested in the farm business, including land and buildings (net of any interest payments on debt capital). FBI closely resembles farm profit. As can be seen, the upland farms have always under-performed relative to their peers except Lowland Livestock in terms of income per farm.

The Average LFA Farm in 2023-24

Although the average LFA farm in the FBS sample does not reflect the wide variation in either the sample, or still more the whole population, its description still provides a general picture of the sector. The average farmed area is 176 ha plus common grazing. This area includes 97 ha of permanent grassland and 62 ha of rough grazing. The average farm is part owned (90 ha) and part rented (86 ha). The average LFA farmer has 23 beef cows and 422 breeding ewes. Cattle and Sheep youngstock make up the total to 77 cattle and 802 sheep on the farm, making a total of 90 Grazing Livestock Units (GLUs) (see Tables 1&2).

Table 1 also illustrates the variation in performance levels within the sector. High performing farms represent the top 25% of farms, Medium the middle 50% and the Low the bottom 25%. The High performing businesses are much larger than the medium and low performers. They can spread their fixed costs over a greater area, have similar income per farm from diversification with the BPS per hectare only slightly lower. The agri-environmental incomes are much higher per hectare than the lower performers.

^{*}There is a break in the series in 2022/23, this represents changes in the method used to assign farms to a specific farm type. The 2022/23 figures have been reworked on the new farm type classifications.

^{*} An increase in valuation is represented as a negative, with funds being used to increase the live and deadstock valuation

The average LFA Grazing Livestock farm in England in 2023/24 is represented by the set of accounts shown in Table 5. This table reports the average farm accounts for the whole sample of 172 farms, broken out by four "cost centres" representing the different aspects of the farm business: agriculture (production agriculture and agricultural contracting) environmental management, diversification (off farm activities except agricultural contracting) and the Basic Payment Scheme. To the extent possible, the variable costs of the business have been separated out as relevant to each of these cost centres, while fixed costs (including depreciation) have also been allocated so far as possible, including the casual labour cost, according to the shares of each centre in total costs.

Table 5 Business Output, Input and Income

| equals Net Farm Income | | | | | | |

Footnotes:

(a) The purpose of this table is to identify the contribution of the various cost centres to the farm business.

Definitions of the measures of income can be found at http://statistics.defra.gov.uk/esg/publications/fab/2009/Appendix2.pdf

- (b) Includes casual labour costs which have been allocated between costs centres in proportion to total costs.
- (c) Interest payments have been allocated between cost centres in proportion to costs, and interest received in proportion to output.
- (d) Assumed to be attributable entirely to agriculture
- (e) Financial return to unpaid labour (farmers and other unpaid partners in the business) and to their capital invested in the farm business, including land and buildings. For corporate businesses it represents the financial return on shareholders' capital.
- (f) Manual labour of farmer, spouse (if unpaid) and unpaid business partners
- (g) Represents the return on own capital invested in the farm business, to risk and to entrepreneurship.
- (h) Represents the return on all capital invested in the farm business whether borrowed or not, to risk and to entrepreneurship.
- (i) Net of imputed rent receipts

On average, these farms only earn some 68% of their total revenue (output) from the agriculture cost centre, with 13% coming from the Basic Payment, and 12% from specific Agri-environment payments. The balance of revenues (7%) is earned from non-farm activities (mostly associated with tourism and recreation and non-agricultural contracting; agricultural contracting is included in the agriculture cost centre). The agriculture cost centre covers its variable costs and earns a positive gross margin of £44,302 per farm (a 6% increase on the previous year). However, since the production agriculture side of the farm business is assumed to incur most of the fixed costs (87%) the average LFA farm is shown to generate an Agricultural Business Income loss of £13,961 per farm in 2023/24 – a loss on the figure of £11,343 in the previous year.

The revenues earned from Agri-environment, diversification and the Basic farm payments more than cover their own costs and can offset the losses from traditional agriculture production activities to generate a headline Farm Business Income (FBI) of £23,505 per farm in 2023/24, a 12% reduction on the previous year. This income covers the opportunity costs of the unpaid labour (provided by the farmer and partners) of £35,599 per farm and as a result, Farm Corporate Income registers at a loss of £12,095 per farm (a further loss on the £6,454 as compared to 2022/23). Adjusting for the net interest payments made by the farm, the Farm Investment Income (which represents the return on risk and entrepreneurship on all capital invested in the farm business whether borrowed or not) is a loss of £5,089, down from the previous year's figure of £1,365.

The traditional measure of farm income is Net Farm Income (NFI). NFI adjusts the business accounts to put all farm business on the same (tenancy) basis. A rental value is imputed for all owner-occupied farms (as a measure of the opportunity cost of owning land) and adjusted for landlord costs. In addition, NFI is gross of the unpaid labour of the principal farmer and spouse (though not that of other partners). NFI is, therefore, an expression of the returns earned by the business to pay the farmer and spouse for their own labour, management and tenant's capital invested in the business. The net result of these adjustments is shown in Table 5, giving an average NFI of £14,669 per farm, down by 14% on 2022/23 and more than a half from 2021/22.

The between year variation in the farm profitability is illustrated in Figure 2. The FBI achieved by Agriculture shows the biggest volatility with the three other strands relatively stable over the last six years. The Agri-environment and Diversification strands are tending to increase whilst the BPS is declining.

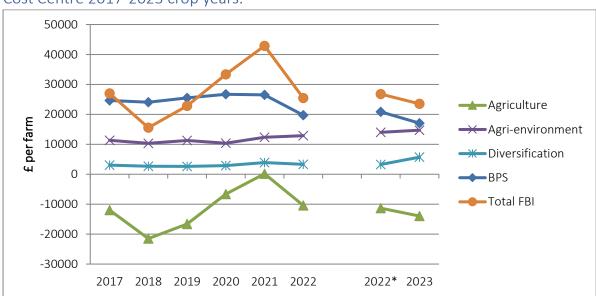

Figure 2 LFA Grazing Livestock farms in England- Average Farm Business Income by Cost Centre 2017-2023 crop years.

There is, as already noted, a substantial range of performance exhibited by the sample. Figure 3 shows the sample distribution by quartile, based on Farm Business Income per farm. The "high" group of farms is the upper quartile of the (weighted) distribution of farms, consisting of the top 25% of farms ranked by FBI/farm, the "low" group of farms and the bottom quartile with the "medium" the middle two quartiles.

Figure 3 also distinguishes between the Agriculture Business Income (ABI) (derived solely from the agricultural enterprises, and excluding environmental, diversification and the Basic Payment Scheme (BPS)) and the Farm Business Income (which includes environmental, diversification and BPS payments). Hence, the difference between the two measures indicates the contribution of the strictly non-agricultural 'enterprises' in the farm business – the environmental schemes, diversification income and BPS payments. As can be seen, only the "high" performers return a positive agricultural income. The "medium" group manages to offset these agricultural losses by the incomes earned through environmental and diversification activities and the BPS, but the lowest quartile is unable to recoup these losses and returns a negative FBI. In general, the better performing farms are larger, approaching three times the farmed area and make greater incomes from their agri-environmental activities.

^{*}There is a break in the series in 2022/23, this represents changes in the method used to assign farms to a specific farm type. The 2022-23 figures have been reworked on the new farm type classifications.

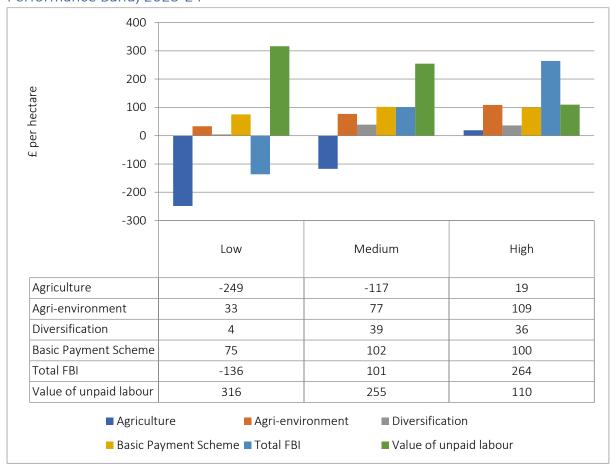

Figure 3 Farm Business Income and Unpaid labour per hectare by Cost Centre, by Performance Band, 2023-24

.

Figure 4 shows the business performance by size, measured here by the Standard Labour Requirement (SLR) and illustrates that size is important to these farms' earning ability.

This figure dramatically demonstrates the weak position of production agriculture to LFA farms with none of the farm sizes making a positive contribution from agriculture. The reliance on the Basic Payment Scheme and Agri-environment incomes is also illustrated, although it is these income streams that rescues all farms from economic failure.

Only the Very Large farms produce a Farm Business Income greater than the value of unpaid labour. A full explanation of the derivation and boundaries of the SLR size bands is given in Appendix 1 and more data can be seen in Appendix 2.

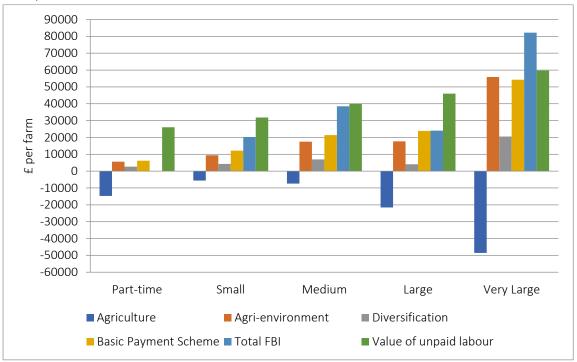

Table 6 Farm Business Income and Basic Payment Scheme, 2023-24

| | 1 | 1 | 1 | 1 | | | |
|-------------------------------------|-----------|------------|--------|---------|--------|---------------|--|
| | All Farms | Part-time | Small | Medium | Large | Very Large | |
| | | £ per farm | | | | | |
| Farm Business Income | 23,505 | -201 | 20,248 | 38,473 | 24,045 | 82,184 | |
| Basic Payment Scheme received | 19,172 | 7,326 | 13,621 | 23,538 | 26,455 | 61,499 | |
| Farm Business Income less BPS | 4,333 | -7,528 | 6,626 | 14,935 | -2,409 | 20,685 | |
| Private drawings | 27,879 | 14,241 | 23,967 | 24,338 | 44,952 | 69,301 | |
| Value of unpaid labour | 35,599 | 26,075 | 31,851 | 39,898 | 46,015 | 59,671 | |
| Change to external funding | -8,595 | -27,447 | 5,764 | -19,381 | 11,605 | -21,291 | |

It has already been highlighted that the value of unpaid labour used during 2023-24 is greater than the Farm Business Income generated by the business in all businesses except the Very Large farms

(Table 6). The same can be said for the level of private drawings taken out of the business relative to income. The private drawings taken out of the business is less than the value of the unpaid labour for those farms which are classified as Large or smaller.

The financing of capital investments, an average of close to £21,000 in 2023-24, required the introduction of private funds, £19,000, but with a decrease in external funds of £8,500 for the average farm.

Figure 5 shows the business performance by LFA farm type. The SDA farms all make a loss from Agriculture and the contributions from Agri-environment and Basic Payment Scheme are linked to the area of land farmed by each LFA farm type. The Specialist Sheep (SDA) farms are the largest farms, on average 262 hectares, followed by the Mixed Grazing Livestock (SDA) farms with the Specialist Beef (SDA) farms the smallest at 162 hectares.

The Various Grazing Livestock (DA) farms are the smallest of the LFA farms at 111 Ha, but they are predominantly 'lower' down the hill with more favourable climate conditions and soils. They break even from Agriculture but have less opportunities with regards to Agri-environment incomes.

Only the SDA Sheep farms have total Farm Business Income greater than the value of the unpaid labour within their businesses. More details can be found in Appendix 3.

Figure 5 Farm Business Income and Unpaid labour per farm by cost centre, by LFA farm type, 2023-24

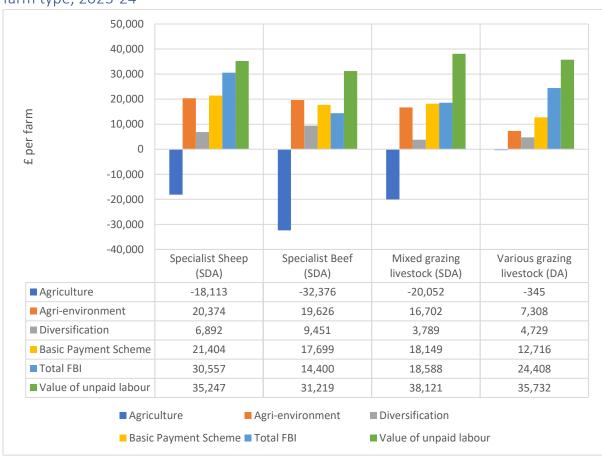

Figure 6 shows the same business performance measures by FBS Region. The average LFA farm in England North is considerably larger but most of the difference is more rough grazing. They keep similar numbers of livestock units with more sheep and less cattle than LFA farms in England East or West — which will partly explain the differences in regional profitability. The England West have higher income from Agri-environment and Basic Payment Scheme on a per hectare farmed basis. More details can be found in Appendix 4.

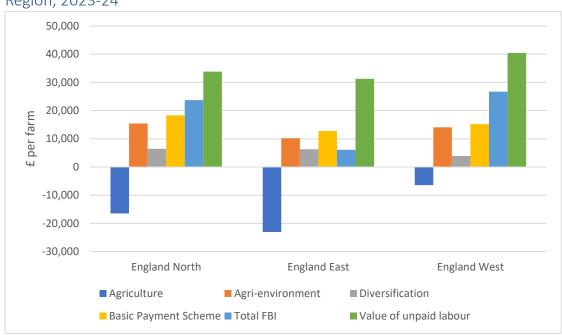

Figure 6 Farm Business Income and Unpaid labour per farm by cost centre, by England Region, 2023-24

LFA Enterprise Gross Margins⁵

The major livestock enterprises on LFA grazing farms are suckler cows, typically producing store cattle (for finishing in the lowlands) and Hill and Upland sheep flocks, typically producing cross-bred ewe lambs (supplying the lowland flocks with breeding stock) and store lambs (also for finishing in the lowlands). Where conditions allow some cattle and lamb finishing also occurs on LFA farms. Enterprise margins for LFA sheep are shown in Table 7 and Figure 7. Upland sheep flocks are those with lambing

_

⁵ Most of the farms within the sample can calculate gross margins for their enterprises. **Enterprises with small numbers of farms have not been included.** Where the sample sizes allow, top third group figures (weighted total population) are also produced. Sample sizes are small for some of these analyses and standard error bars have been included in the figures to indicate the accuracy of the estimate of the mean. Error bars are shown on 95% confidence intervals as a measure of the uncertainty that may apply to the estimated means. These signify that we are 95% confident that this range contains the true value. They are calculated as the standard error (se) multiplied by 1.96 to give the 95% confidence interval (95% CI)

rates typically more than 100% and more typically found on lower altitude than Hill sheep flocks (lambing rates typically less than 100%).

^{*} Top Third of Weighted Population

The average gross margin per ewe for the 2023-24 year is little changed for the Upland flocks as compared to the previous year with the Hill flocks seeing a 23% increase. The top third producers for

[†] Forage includes seeds, fertilisers, sprays and other crop costs

[‡] Restricted to concentrates, coarse fodder, veterinary and medicines, other livestock costs and forage.

the Upland flocks have broadly similar variable costs, but higher output and gross margins 74% higher than the average. The top third producers for the Hill flocks have higher variable costs, closer to the level of the Upland flocks, but also higher output and gross margins 79% higher than the average.

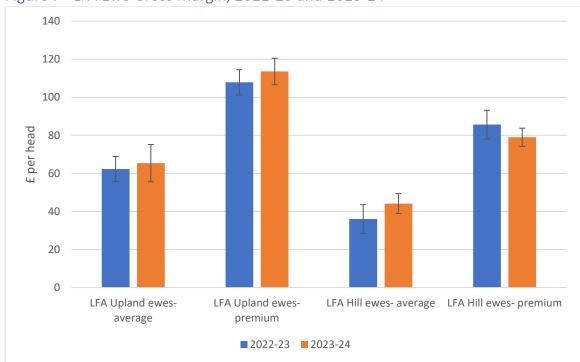

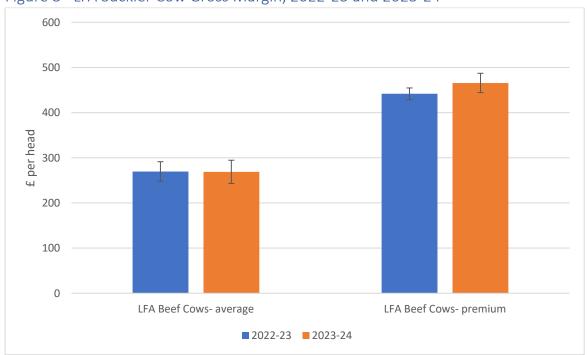

Figure 7 –LFA Ewe Gross Margin, 2022-23 and 2023-24

LFA suckler cow gross margins are shown in Figure 8 and Table 8. The average LFA suckler cow gross margin per cow is unchanged between 2022-23 and 2023-24 but the top third producers showed a slight improvement (5%) between years. There performance per cow is 73% higher than the average producer.

Appendix 1 The Farm Business Survey (FBS)

General

The FBS sample covers businesses with an economic Standard Output of 25,000 Euros and above. Practically all the sampled accounts close within the four months from the end of December to the end of the following April with concentrations at the close of the calendar year and towards the end of March and early April. About 75 per cent of the accounts close during these two peak periods. Thus, the results relate, on average, to March-February years.

Classification of survey farms by type of farming and size of business

A revised classification of farm types was introduced in 2010/11 based on Standard Outputs, which caused changes to the distribution of farms by farm type. Further details of the revised classification and its effect on the FBS sample may be found at: https://www.gov.uk/farm-business-survey-technical-notes-and-guidance

The lower size threshold for the Farm Business Survey was also changed from 0.5 Standard Labour Requirements (in annual full-time equivalents) to a standard output of 25,000 Euros. Therefore, the results published here relate to farms for which the total standard output from cropping and stocking activities is at least 25,000 Euros.

The Standard Labour Requirement (SLR) of a farm represents the normal labour requirement, in Full Time Equivalents, for all the enterprises on a farm under typical conditions. The SLR for a farm is calculated from standard coefficients applied to each enterprise on the farm. The standard coefficients represent the input of labour required per head of livestock or per hectare of crops for enterprises of average size and performance.

Farms in the sample are grouped by type of farm based on the EC system of classification defined by Commission Decision 1242/2008 (with minor modifications to adapt it to United Kingdom conditions) and Standard Outputs per hectare of crop area and per head of livestock estimated over the period 2008-2012.

The Standard Output (SO) is a financial measure used to classify farm type. Standard outputs measure the total value of output of any one enterprise - per head for livestock and per hectare for crops. For crops, this will be the main product (e.g. wheat, barley, peas) plus any by-product that is sold, for example straw. For livestock it will be the value of the main product (milk, eggs, lamb, pork) plus the value of any secondary product (calf, wool) minus the cost of replacement. Up until 2010, standard gross margins were used for the classification of farms. The difference between standard outputs and standard gross margins is that no variable costs are deducted in the derivation of standard outputs. Each farm is assigned a total SO by aggregating the SOs for its agricultural enterprises. The farm is classified into a 'particular' type of farming by evaluating the proportion of its total SO deriving from different enterprises.

From 2023/24, the classification of farms is based on 2017 standard output (SO) coefficients. 2022/23 results have been recalculated and presented in this report on 2017 SO coefficients to allow comparability between 2022/23 and 2023/24⁶. The results published here are therefore not directly comparable with those published in reports in earlier years which are based on previous SO

⁶ https://www.gov.uk/guidance/changes-to-farm-typology-use-of-2017-standard-output-coefficients

coefficients. Results for 2022/23 based on the previous SO coefficients can be found at: <u>FBS Region Reports</u>

The characteristics of each farm type are summarised as follows:-

Cereals- Farms on which cereals, oilseeds, peas and beans harvested dry account for over two-thirds of their total SO (holdings with more than two-thirds of their total SO in set-aside are excluded from the survey results).

General cropping- Farms with over two-thirds of their total SO in arable crops (including field scale vegetables) or a mixture of arable and horticultural crops; and holdings where arable crops account for more than one-third of total SO and no other grouping accounts for more than one-third.

Dairy-Farms where the dairy enterprise, including followers, accounts for over two-thirds of their total SO.

LFA grazing livestock-Farms with more than two-thirds of their total SO in cattle and sheep except holdings classified as dairy. A farm is classified as in the LFA if 50% or more of its total area is in the Less Favoured Area (both Disadvantaged and Severely Disadvantaged).

Lowland grazing livestock-Farms with more than two-thirds of their total SO in cattle and sheep except holdings classified as dairy. A farm is classified as "lowland" if less than 50% of its total area is in the Less Favoured Area.

Horticulture- Holdings on which fruit (including vineyards), hardy nursery stock, glasshouse flowers and vegetables, market garden scale vegetables, outdoor bulbs and flowers, and mushrooms account for more than two thirds of their total SO.

Specialist pigs- Farms on which pigs account for over two-thirds of their total SO.

Specialist poultry - Farms on which poultry account for over two-thirds of their total SO.

Mixed farms- Farms where crops account for one-third, but less than two-thirds of total SO and livestock accounts for one-third, but less than two-thirds of total SO. It also includes holdings with mixtures of cattle and sheep and pigs and poultry and holdings where one or other of these groups is dominant, but does not account for more than two-thirds of the total SO.

Farm business size in the United Kingdom is measured in Standard Labour Requirements (SLR) expressed in terms of full-time equivalents. Five size groups are defined for this report:

Part-time (less than 1 SLR)
Small (greater than or equal to 1 less than 2 SLR)
Medium (greater than or equal to 2 less than 3 SLR)
Large (greater than or equal to 3 less than 5 SLR)
Very Large (greater than or equal to 5 SLR)

Farms are allocated to performance bands according to total farm output divided by total farm costs. The farms are then ranked and allocated to groups representing 25, 50 and 75 percentiles: equivalent to low, medium and high performance bands.

Weighting Procedure

All results in this report are weighted to provide estimates for the population. The weights are based on the ratio of numbers of businesses in the population (as given by the June Survey) and in the sample within each farm type and size group. These weights are then further refined by a calibration process

using information from sources other than the Census (mostly administrative data). For more information on the FBS weighting procedure and other statistical issues, please see: https://www.gov.uk/farm-business-survey-technical-notes-and-guidance

Definition of Terms

Utilised agricultural area is the crop area, including fodder, set-aside land, temporary and permanent grass and rough grazing in sole occupation (but not shared rough grazing) i.e. the agricultural area of the farm. It includes bare land and forage let out for less than one year.

Total area of farm is the utilised agricultural area plus woodland and other areas of the farm not used for agriculture (e.g. buildings, roads, water, and household gardens).

Total tillage comprises the utilised agricultural area, plus bare land and forage hired in from others in the accounting period, minus temporary and permanent grass and rough grazing in sole occupation (but not shared rough grazing).

Total area farmed comprises the total area of the farm minus woodlands and buildings, etc. plus net land hired in.

Adjusted utilised agricultural area comprises the utilised agricultural area with rough grazing in sole occupation converted to a permanent pasture equivalent.

Stocking figures are the average annual level of stocking based on estimated average livestock numbers on the farm for the year, including fractions for livestock on the farm for less than a year.

Total livestock units are used as an approximate measure of stocking intensity and are based on the estimated energy requirements of different species and ages of livestock. A summary of the main livestock units is shown below.

| Dairy cows | 1.00 LU | Beef Cows | 0.75 LU | Heifers in calf | 0.80 LU |
|------------------------|---------|---------------------|---------|-----------------------|---------|
| Cattle over 2 years | 0.80 LU | Cattle 1-2 years | 0.65 LU | Cattle 0-12 months | 0.34 LU |
| Bulls | 0.75 LU | Lowland Ewes | 0.10 LU | Upland Ewes | 0.08 LU |
| Hill Ewes | 0.06 LU | Store lambs | 0.04 LU | Rams | 0.08 LU |

Annual labour units (ALU) are the estimated number of full-time worker equivalents of persons working on the holding during the year. Part-time workers are converted to full-time equivalents in proportion to their actual working time related to that of a full-time worker. One ALU represents one person employed for 2,200 hours.

Enterprise output is the main measure of individual crop and livestock output. It comprises:

(a) *Cash crop enterprise output*, which is the total value of cash crops produced by the farm (other than losses in the field and in store) including *direct crop subsidies* due. It includes crops used for feed and seed by the farm business and those consumed in the farmhouse and by farm labour. Crop enterprise output is calculated on a "harvest year" as distinct from an "accounting year" basis; that is, it refers only to those crops (except for certain horticultural crops) wholly or partly harvested during the accounting year and excludes any crop carried over from the previous year. Thus, valuation

changes (between the previous and current crops) are not relevant, and the total harvested yield of the crop is valued at market prices (plus any subsidies). However, any difference between the opening valuation of any stocks of previous crops and their ultimate disposal value (sales, used on farm and any end-year stocks) is included in total farm output and net farm income.

- (b) *By-products, forage and cultivations*, which cover the value of output of the by-products of agricultural activity, sales of fodder, valuation changes for fodder and cultivations. It also covers revenue from the letting of bare land or forage on a short-term lease.
- (c) *Livestock enterprise output* comprises the total sales of livestock and livestock products, part of the valuation change (see below), produce consumed in the farmhouse and by labour and the value of milk and milk products fed on the farm (excluding direct suckling) adjusted for debtors at the beginning and end of the year and transfers between enterprises; less purchases of livestock and livestock products from outside the farm business. Stock appreciation for breeding livestock (cattle, sheep and pigs) has been excluded from individual livestock enterprise outputs. However, changes in the numbers of breeding livestock between the opening and closing valuation and the total valuation change of trading livestock are included. Unlike crop enterprise output, livestock enterprise output is calculated on an accounting year basis.
- (d) **Rental Income** comprises the renting-out of farm cottages and other buildings, where these are inseparable from the main farm account.
- (e) Contract work includes returns from the use of farm resources for hire work
- (f) *Miscellaneous output includes* returns from recreational activities, added value activities, the private share of the rental of the farmhouse and the value of any farm labour or other inputs used for producing capital assets for the farm.

Total farm output is the sum of crop and livestock enterprise output, income from the Agrienvironment schemes, Basic payment scheme and miscellaneous output, and the adjustment for previous years' crops. It excludes breeding livestock stock appreciation.

Inputs comprise payments and the estimated value of non-cash inputs, including home-grown feed and seed, adjusted for changes in stocks and creditors between the beginning and end of the year. The appropriate share of any input not used entirely by the farm business is deducted.

Total variable costs

These are taken to be costs of feed, veterinary fees and medicines, other livestock costs, seeds, fertilisers, crop protection and other crop costs.

Concentrate feed includes (a) bought compounds and grains, sugar beet pulp, proteins, milk powder, animal and plant proteins, additives, minerals and vitamins; and (b) home produced cereals, beans, peas, milk and milk products, valued at the average ex-farm price.

Purchased Fodder includes purchased bulk feeds such as potatoes, vegetable residues, wet brewers' grains, hay and feed straw, and agistment. It does not include forage produced on the holding. Payments for grass keep and bare land are shown with land charges.

Veterinary fees and medicines consist of veterinary fees and the cost of all medicines.

Other livestock costs include all expenditure relating directly to livestock production such as freeze branding, AI fees, milk tests, breed society fees, dairy and other detergents, packing materials, bedding

straw, show expenses, processing and marketing charges, disposal of casualties, etc.and other livestock costs not separately identified.

Seeds This comprises expenditure on purchased seeds, plants and trees adjusted for changes in stocks. Home-grown seed from the previous crop is included and charged at estimated market price: any seeds from current crops and sown for a succeeding crop are excluded but are included in the closing valuation of the crop and hence in enterprise output. This enables the value of homegrown seed used in the production of the current crop to be identified.

Fertilisers This includes lime, fertilisers and other manures, and is adjusted for changes in stock. Fertilisers sown for next year's crops are treated as if they were still in store and are included in the closing valuation.

Crop protection This includes costs of pre-emergent sprays, fungicides, herbicides, dusts and insecticides and other crop sprays.

Other crop costs include all expenditure relating directly to crop production such as packing materials, baler cord, soil analyses, crop competition costs, polythene (for tunnels), all storage and market preparation costs, purchase of standing crops, marketing charges, soil sterilisation, etc. It also includes the cost of renting bare land (for growing cash crops) for less than one year.

Total fixed costs

These are the costs of labour, machinery, contract work, land and buildings, other general farming costs and depreciation.

Labour (excluding farmer and spouse) costs include all work in connection with the normal running of the holding including field work, livestock husbandry, market preparation, maintenance, transport and other related operations. They exclude work to produce fixed assets (construction or repairs of buildings and machinery, etc.), domestic work and business travel/professional meetings, etc.
'Unpaid' labour is valued at the appropriate rate for the work done. The value of the manual labour of the farmer and spouse is not charged as an input in calculating net farm income.

Contract costs These costs include expenditure on work carried out by agricultural contractors, including the costs of materials employed, such as fertilisers, unless these can be allocated to the specific heading. Costs of hiring machines to be used by the farm's own labour are also included. Expenditure on contract labour is only included here if it is associated with the hiring of a machine. Otherwise, it is entered under (casual) labour.

Machinery costs relate to all machinery and equipment items, which originally cost more than £500, including the farm *share* of road vehicles. Depreciation is calculated on a replacement cost basis (broadly equivalent to 15% of current replacement costs). Repairs are recorded net of insurance receipts.

Land expenses include tenant-type repairs and land upkeep costs as Property repairs, the actual rents paid by tenant farmers and drainage rates where incurred. Payments for grass keep and bare land are also included. For land and buildings owned a 'rental value' is included based on similar payments made by tenants in similar circumstances.

General overheads include the farm share of electricity, heating fuel, water, insurance (including labour and buildings insurance) and professional fees. Bank charges, secretarial costs, consultancy fees and other sundry costs (such as subscriptions, telephone, postage, stationery, etc.) are included in Other general costs.

Net Farm Income (NFI) is intended as a consistent measure of the profitability of tenant-type farming which allows farms of different business organisation, tenure and indebtedness to be compared. It represents the return to the farmer and spouse alone for their manual and managerial labour and on the tenant-type capital invested in the farm business.

To represent the return to farmer and spouse alone, a notional deduction is made for any unpaid labour provided by non-principal partners and directors, their spouses and by others; this unpaid labour is valued at average local market rates for manual agricultural work.

To confine the measure to the tenant-type activities and assets of the business, an imputed rent is deducted for owner-occupied land and buildings and for landlord-type improvements made by the tenant. No deduction is made for interest payments on any farming loans, overdrafts or mortgages; interest earned on financial assets is also excluded.

Because of these two restrictions, NFI is not a proxy for farm business income; other measures, such as Net Profit and Family Farm Income should be used instead. Nor is it a proxy for farm household income both because NFI does not accurately represent the farmer and spouse share of the business and because it takes no account of any income from off-farm sources.

Breeding livestock stock appreciation represents the change in market prices of breeding cattle, sheep and pigs between the opening and closing valuations.

Farm business income (FBI) for sole traders and partnerships represents the financial return to all unpaid labour (farmers and spouses, non-principal partners and directors and their spouses and family workers) and on all their capital invested in the farm business, including land and buildings. It is defined as Total Farm Output (TFO) plus profit / loss on sale of assets minus cost (C): where TFO is defined as the sum of output from: crop enterprises, adjustment for disposal of previous crops, livestock enterprises, separable non-agricultural diversification, Basic farm payment, agrienvironmental payments, other grants and subsidies, miscellaneous receipts; C is defined as variable costs plus fixed costs. Note that prior to 2008/09 directors' remuneration was not deducted in the calculation of farm business income. For corporate businesses it represents the financial return on the shareholders capital invested in the farm business. It is used when assessing the impact of new policies or regulations on the individual farm business. Although Farm Business Income is equivalent to financial Net Profit, in practice they are likely to differ because Net Profit is derived from financial accounting principles whereas Farm Business Income is derived from management accounting principles. For example, in financial accounting output stocks are usually valued at cost of production, whereas in management accounting they are usually valued at market price. In financial accounting depreciation is usually calculated at historic cost whereas in management accounting it is often calculated at replacement cost.

Farm corporate income represents the return on own capital invested in the farm business, to risk and to entrepreneurship. It is derived by deducting unpaid labour, both manual and managerial, from Farm Business Profit. This allows the profitability of sole traders and partnerships to be compared directly with that of other companies. Currently we can deduct an estimate of unpaid manual labour but not of unpaid managerial labour and so the data are only approximate. However, we plan to undertake a research project to produce a method for deriving an estimate of unpaid managerial labour, so that we can produce better data for this measure in future.

Farm investment income represents the return on **all** capital invested in the farm business **whether borrowed or not**, to risk and to entrepreneurship. It is a general measure of the profitability of farming as an activity rather than of a particular business.

It is derived by adding net interest payments to Farm Corporate Income. Since currently the data for Farm Corporate income are only approximate, so too are the data for Farm Investment Income.

Balance Sheet Tables

Total fixed assets include milk and livestock quotas, as well as land, buildings, breeding livestock, and machinery and equipment. For tenanted farmers, assets can include farm buildings, cottages, quotas, etc., where these are owned by the occupier.

Bank term loans and other long and medium term loans are loans which exceed 12 months.

Net Worth represents the residual claim or interest of the owner in the business. It is the balance sheet value of assets available to the owner of the business after all other claims against these assets have been met.
